# 20 STAMH<sup>®</sup> years

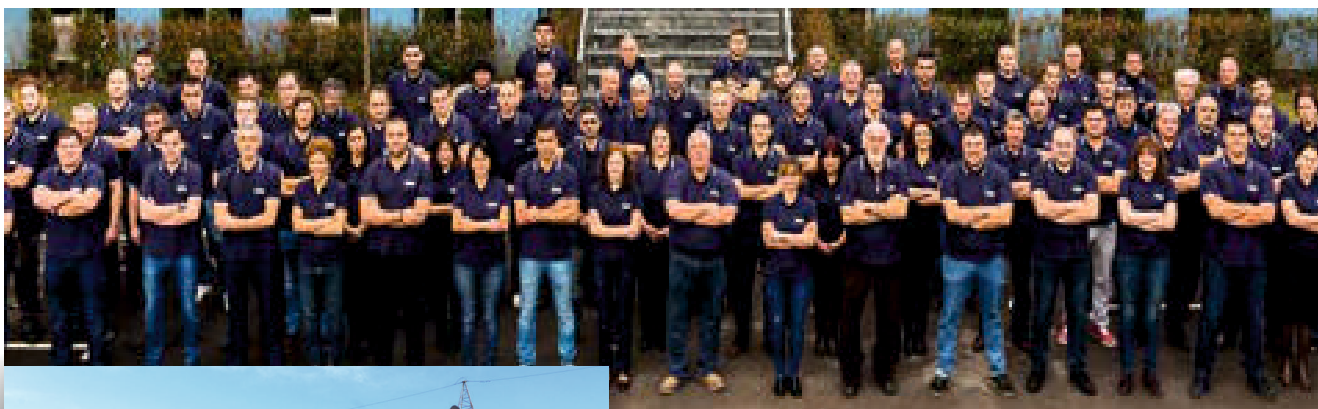

**STAMH<sup>®</sup>** is an engineering company that performs consulting, design and engineering of complex automation and mechanized warehouses, including management software. The territory in which it operates and has its own companies and representative offices is in Bulgaria, Greece, Macedonia, Romania and Serbia and Russia.

Our main products are:

- Ÿ Different type of Automated Storage systems for boxes and for pallets including racks, stacker cranes, conveyers and Management system.
- Ÿ Vertical Automated Storage and Retrieval system for

office and industrial applications

- Ÿ Dynamic roll systems for pallets and boxes, all kinds of roll and belt conveyers and automated sorter systems
- Ÿ Mobile racking systems for pallets and long material
- Ÿ Palletizers and robocars
- Ÿ Warehouse management software WMS
- Ÿ Lifting equipment
- Ÿ Professional cleaning machines

## LIVE STORAGE

- φ Optimal turnover of items in FIFO method
- φ Maximize capacity of available warehouse space
- φ Perfect control of goods
- φ Possibility of integrating of Pick to light system
- φ Minimum time for order preparation
- φ Wide variety of articles in front of the rack

Live storage racking system for palletized loads are compact structures that incorporate roller track sections placed on a slope lane to allow the pallets sliding. The pallets are placed at the highest part of the rolling section and move by the forces of gravity and at controlled speed towards the other end where they remain until ready to be removed. This minimizes the time needed for certain operations and saves working space. Live storage enables perfect rotation of stored products applying FIFO system. This makes it ideal for storing perishable goods.

The huge advantages and versatility of this system make it suitable for use in any industry or distribution sector such as food, automobile, pharmaceutical, chemical, etc.

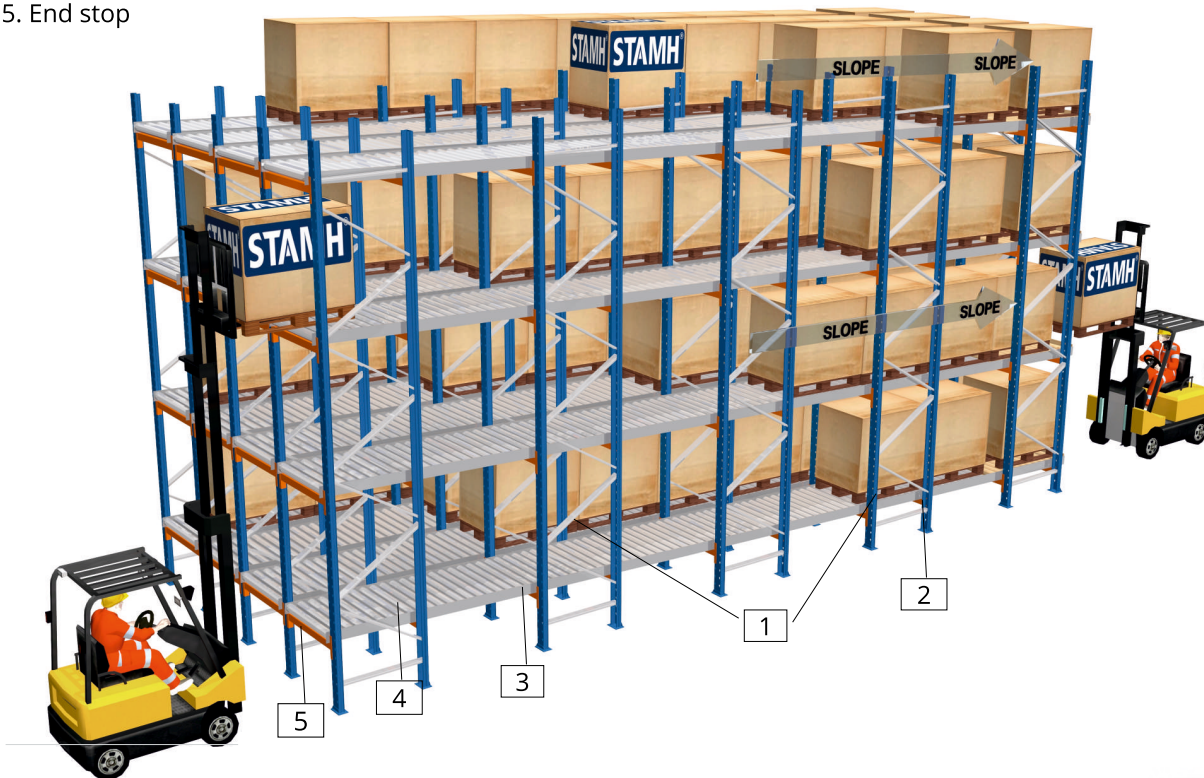

## ELEMENTS:

1. Frames
2. Dynamic beams
3. Dynamic profile
4. Roller beds
5. End stop

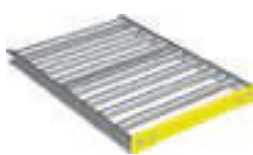

These racks incorporate roller track sections placed on a sloped lane to allow the pallets to slide over them. The pallets are put in at the highest part of the rolling section and move by the force of gravity and at a controlled speed towards the other end.

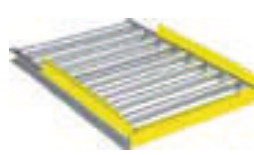

Brake rolls - part of every roller track and regulate the speed, so the goods move safely and controlled.

Side profile - galvanized U or C profile 80x40x3

End stop- part of unloading element. It is a pallet stop, roller guard and path guide.

Entry guides- makes easy the placement of the pallet

Manual separator for picking operation

Picking tunnel integrated in the system.
